Understanding paraphilias including paedophilia
Establish class values

- We will be talking about sexuality, gender, pleasure, abuse and safety in these sessions. What will make this class a safe space for everyone to share, express their views and discuss freely?
- How do we want others to behave?
- How will we behave?
Paraphilia - what is it?

What’s true?
1. Paraphilias = unusual / atypical sexual behaviour
2. Paraphilia = mental disorder
3. Paraphilia = criminal sexual acts
4. Paraphilia = curable disease

Paraphilia (n.) Greek para- "beside, aside" (see para- (1)) + philos "loving" (see -phile)

</table>
In DSM-5 the term paraphilia is defined as “any intense and persistent sexual interest other than sexual interest in genital stimulation or preparatory fondling with phenotypically normal, physiologically mature, consenting human partners.”

People with paraphilias have recurrent, intense sexually arousing fantasies, sexual urges, or behaviours that generally involve:

1. Non-human objects
2. The suffering or humiliation of oneself or one’s partner, or
3. Children or other non-consenting persons

Paraphilias - where the preferred sexual interest(s) are greater than nonparaphilic sexual interests.
Disorder vs behaviour

DSM V - paraphilic disorders includes eight conditions:

1. exhibitionistic disorder,
2. fetishistic disorder,
3. frotteuristic disorder,
4. pedophilic disorder,
5. sexual masochism disorder,
6. sexual sadism disorder,
7. transvestic disorder,
8. voyeuristic disorder.
Paraphilic disorder

DSM-5 requires that the person

- feel personal distress about their interest, not merely distress resulting from society’s disapproval;
  or

- have a sexual desire or behavior that involves another person’s psychological distress, injury, death, or
  or

- a desire for sexual behaviors involving unwilling persons or persons unable to give legal consent
Paedophilia, paedophilic disorder

According to DSM V (APA 2013)

**Paedophilia** (criteria A only) and **Paedophilic disorder** (where criteria A and B are met)

A. an adult, for at least 6 months has recurrent, intense sexual urges or fantasies about sexual activity with a pre-pubescent (less than 14 years old) child(ren). (acting on these desires is not necessary for the diagnosis)

B. The individual has acted on the sexual urges or the fantasies or urges cause marked distress or interpersonal difficulties

Paedophilia may be:
- **exclusive** (attracted to children alone) or **non exclusive** (attracted to children and adults)
- **attracted to females, or males or both**
Paedophilia

- Paedophilia is defined by **body maturity**, not the age, of the preferred partner
- Paedophilia frequently involves fondling or manipulation of the child’s genitals and occasionally penetration
- Injuries may result from the sexual act - and are usually a by product rather than the goal
- **Pedophilia** - primary or exclusive sexual interest in prepubescent children - (the DSM-5 extends the prepubescent age to 13)
- **Hebephilia** is the strong, persistent sexual interest by adults in pubescent children who are in early adolescence, typically ages 11–14 and showing Tanner stages 2 to 3 of physical development.
- **Pedohebephilia** - attracted to both above
- **Ephebophilia** is the primary sexual interest in mid-to-late adolescents, generally ages 15 to 19. Partly because puberty varies, some definitions show overlap between pedophilia, hebephilia and ephebophilia. For example, the DSM-5 extends the prepubescent age to 13, the ICD-10 includes early pubertal age in its definition of pedophilia and some definitions of ephebophilia include age 14.
Tanner’s stages of puberty

Paedophilia and child sexual abuse

All perpetrators of child sexual abuse are *not* pedophilic.

Many pedophilic persons *do not* sexually abuse children. They manage their sexual urges towards children in other ways.
### The difference between pedophilia and child sexual abuse

#### Pedophilia
- Research is tilting towards considering pedophilia as an orientation - it describes the sexual interest in children and/or adolescents.
- Many have feelings of guilt about their sexual urges and fantasies.
- Distress often extends to and affects their personal, social and occupational life and relationships.
- Many persons with paedophilia **never act out on their impulses** and abstain from abusing a child.
- Defined by body maturity (for instance, Tanner’s stages of pubertal changes), and not the age of the sexual partner. Sexual activity with a person in late adolescence may not concern a person with pedophilic disorder.

#### Child sexual abuse
- Child sexual abuse is a **behaviour**.
- It is illegal and harmful - involves physical or psychological coercion or at least one individual who cannot reasonably consent to the act.
- The perpetrator **usually does not feel guilt/distress**.
- The perpetrator maintains personal, social, occupational relationships.
- Perpetrators groom children.
- Includes actions performed by people with pedophilic disorder.
- Defined by age of the child, not body maturity.
Pedophilia – a sexual orientation?

- According to Dr James Cantor, of the Centre for Addiction and Mental Health in Toronto, Canada, "Paedophilia is something that we are essentially born with, does not appear to change over time and it's as core to our being as any other sexual orientation is"

- Cornwell et al studied brain MRI scans of pedophiles and non-paedophiles and found that
  - There were differences in the neural networks of paedophilic individuals as compared to non-pedophiles.
  - There seemed to be "cross-wiring" in the brain.

"It's as if, in these people, when they perceive a child, it's triggering the sexual instincts instead of triggering the nurturing instincts," says Dr Cantor.

Face perception and motivation in humans

- Human faces depict age cues including cues to sexual maturity. This stimulates the appropriate reproductive behaviour: either caretaking (nurturing) or mating (sexual behaviour) when adults see a child or an adult face, respectively. (J Ponseti et al)
- Human face processing is tuned to sexual age preferences. Brain networks that normally are tuned to mature faces of the preferred gender show an abnormal tuning to sexual immature faces in paedophilia.
- They used (fMRI) to test for the existence of a network which is tuned to face cues of sexual maturity. During fMRI, participants sexually attracted to either adults or children were exposed to various face images. In individuals attracted to adults, adult faces activated several brain regions significantly more than child faces. These brain regions comprised areas known to be implicated in face processing, and sexual processing. The same regions were activated in paedophiles, but with a reversed preferential response pattern.

A pedophilic disorder is characterised by abnormal sexual urges towards prepubescent children.

Child abusive behavior is frequently a result of lack of behavioral inhibition.

Authors studied if there is decreased inhibitory neurotransmitters - GABA - in brain regions involved in attentional control of behavior and perception of salient stimuli in 13 pedophilic sex offenders and 13 matched controls.

In a region related to cognitive control and salience mapping, pedophilic sex offenders showed reduction of the inhibitory neurotransmitter GABA which may be seen as a neuronal correlate of inhibition and behavioral control.

Pedophilic sex offenders are characterised by reduced GABA concentration in dorsal anterior cingulate cortex - Author links open overlay pane

Person with paedophilia

- often feels guilty about their sexual urges and fantasies
- faces the possibility of social rejection
- carries the burden of disclosing/ seeking help.
- their orientation affects their personal, social and occupational life and relationships

"People, they think 'why should we help the paedophile? We should be prosecuting them, throwing them in jail, having them castrated'. But if we offer help to paedophiles we might save children who might have been abused." - Paul Jones, father of April Jones who was abducted and murdered by a paedophile in October 2012.

(Are paedophiles' brains wired differently? 24 November 2015, BBC News)
The KEM Hospital Research Centre (KEMHRC) offers ‘Programme for Primary Prevention of Sexual Violence (PPPSV)’, providing treatment for individuals sexually attracted towards children.

The programme has been culturally and socio-legally adapted from ‘Prevention Project Dunkelfeld’ (PPD) introduced in 2005 by Klaus Beier, Charité University Clinic, Germany. For the past 12 years, PPD has been successfully working towards providing assessment and treatment to individuals with a sexual interest in children.

The initiative aims at providing assessment and treatment for persons with a sexual interest in children and/ or young adolescents who have just entered puberty.

Studies conducted abroad specify that possibly one in a hundred persons might have paedophilic characteristics.

- #DontOffendSeekHelp  Dont Offend India
- Troubled Desire offers online self-management for people who feel attracted to children and early adolescents and don't have the chance to get in real contact with therapists. They would like to alleviate the distress experienced by those who have a sexual attraction towards children or young adolescents and to ultimately prevent child sexual abuse and the use of child abuse images. https://troubled-desire.com/en/
From: https://dontoffendindia.org/index.php

It is our basic understanding that no person with pedophilia and/or hebephilia has chosen their sexual preference and that an offence-free life with pedophilia/hebephilia is possible. We believe that no one is guilty for their desires, but everyone is responsible for their behaviour.

In person treatment is currently available in two cities; Pune (KEM Hospital Research Centre) and Mumbai (individual therapists). It is completely confidential and free of cost. The goal of the therapy is to overcome problems in dealing with one's sexual preference. Especially noteworthy is the ability to control one's behavior in such a way that sexual offences against children are entirely avoided.

Some components of the therapy include:

- Having an appropriate perception and evaluation of sexual desires and needs
- Developing the ability to identify and cope with risky situations
- Improving interpersonal relationships
- Improving quality of life
Fetishism

- **Fetish** (n.) "material object regarded with awe as having mysterious powers...," 1610s, Portuguese feitiço "charm, sorcery, allurement," noun use of an adjective meaning "artificial."
- Almost any body part or object can be a **Fetish** - hair, ears, hands, underclothing, shoes, perfume, and similar objects associated with the opposite sex.
- The mode of using these objects to achieve sexual excitation and gratification varies considerably, but it commonly involves masturbating while kissing, fondling, tasting, or smelling the objects.
- Fetishistic Disorder a diagnosis under DSM 5
  - For at least 6 months, recurrent, intense sexually arousing fantasies, urges, or behaviours involving the use of non-living objects or a specific part of the body which is not typically regarded as erotic.
  - The fantasies, urges, or behaviours cause distress or impairment in functioning
Transvestite - 1920s: from German *Transvestit*, from Latin *trans*- ‘across’ + *vestire* ‘clote’.

Magnus Hirschfeld coined the word *transvestite* in 1910 to refer to the sexual interest in cross-dressing. He used it to describe persons who habitually and voluntarily wore clothes of the opposite sex.

**DSM 5**

Transvestic disorder - identifies people who are sexually aroused by dressing as the opposite sex but who experience significant distress or impairment in their lives—socially or occupationally—because of their behavior.

*DSM-IV* limited this behavior to heterosexual males; *DSM-5* has no such restriction, opening the diagnosis to women or gay men who have this sexual interest.
"Frottage" derives from the French verb frotter, meaning "to rub". The term frotteur, originally meaning "floor polisher", entered police jargon around 1882. ... Clifford Allen later coined frotteurism in his 1969 textbook of sexual disorders.

Frotteurism is a paraphilic interest in rubbing, usually one's pelvic area or erect penis, against a non-consenting person for sexual pleasure. It may involve touching any part of the body, including the genital area.
Sadism, Masochism

**Masochism** - the tendency to derive sexual gratification from one's own pain or humiliation. Late 19th century: named after Leopold von Sacher-Masoch (1835–95), the Austrian novelist who described it. **sadism** (n.) "love of cruelty," 1888, from French sadisme, from the name of Count Donatien A.F. de Sade (1740–1815) notorious for cruel sexual practices he described in his novels. **Sadism** - The enjoyment of inflicting pain without pity.

**DSM 5 - Sexual Sadism** - the person experiences persistent and intense sexual arousal from causing or fantasizing about the physical or mental suffering of another person, with or without their consent.

**BDSM** - includes various sexual practices or roleplaying that have elements of bondage or discipline, dominance and submission, sadomasochism, and other related interpersonal dynamics. Consent, safety precautions are essential. It is not a clinical diagnosis - people self-identify.
What causes paraphilias?

• Causes. Usually begin around puberty. More in men than in women.
• A result of classical and instrumental conditioning and/or social learning that occurs through observation and modelling.
  – Classical conditioning - Pavlov’s reflex/ avoiding dentists!
  – Instrumental conditioning - a voluntary response is strengthened or weakened, depending on its favourable or unfavourable consequences
  – Conditioning explains many of the reactions we have to stimuli in the world around us - you might have a particular fondness for the smell of a certain perfume or aftershave lotion because the feelings and thoughts of an early lover come rushing back whenever you encounter it
  – Fetishism- Pavlovian association between an erotic sensation or anticipation, and objects which become mentally associated with that activity.
  – Neurological differences - region processing sensory input from the feet are right next to the region processing genital stimulation. Link between these regions - foot fetishism.

• Male greater vulnerability to paraphilias- greater dependence on visual sexual imagery, and physical stimulus than emotional context as compared to females.
Management: reducing distress, preventing crime

Current understanding - The content of paraphilia is neurobiological - and cannot be changed. Aim - reduce discomfort/ distress and prevent criminal behaviour. Person rarely seeks help unless someone becomes an unwilling partner or is injured.

Psychotherapy - first choice

Pharmacological agents (medicines)

SSRIs - Selective serotonin reuptake inhibitors (SSRIs) reduce sexual arousal, compulsivity, and depressive symptoms - exhibitionists, non-offending pedophiles, and compulsive masturbators.

Antiandrogens / MPA/ GnRH Agonists in more severe cases - they work by reducing androgen levels - has been shown to substantially reduce sexual fantasies and offending behaviors. Due to the side effects, the World Federation of Societies of Biological Psychiatry recommends that hormonal treatments only be used when there is a serious risk of sexual violence, or when other methods have failed.
Some of the effective interventions are:

- **Cognitive-behavioural therapy (CBT)**
  - develop strategies to avoid acting on their interests.
  - identify and cope with factors that make acting on their interests more likely, such as stress.

- **Orgasmic reconditioning**
  - person is instructed to masturbate to their typical stimulus. Just before orgasm, the person is told to concentrate on a more acceptable fantasy.

- **Social skills training**
  - working on issues such as developing intimacy, carrying on conversations with others.

- **Group therapy**
  - helps individuals break through the denial.
This PowerPoint is part of a project to prevent Gender based violence. This project is supported by Ford Foundation.
